

# Valheim Mod Setup

One-time install, about 10 minutes. After this, playing modded is a single click.

**You need:** Valheim on **Steam** (PC — the Xbox / Game Pass version does not support mods), and the **profile code** from Light (or, as a fallback, the mod file he sends you).

## Step 1 — Install the mod manager

1. In a browser, go to **valheim.thunderstore.io** and click “**Get Manager**” at the top of the page. This downloads **r2modman**, the standard Valheim mod manager.
2. Run the downloaded installer, then open r2modman.
3. It asks which game to manage: search **Valheim**, click it, then click **Select game**.
4. On the profile screen, click **Create new**, name it (e.g. **Modded**), and select it.

Mods live inside this profile only. Launching Valheim normally through Steam stays 100% vanilla — nothing about your regular game changes.

## Step 2 — Install the mods (easiest: one code)

1. Get the current **profile code** from Light (short code, looks like 0189a7c2-...).
2. In r2modman, go to the profile screen → **Import / Update** → **Import new profile** → **From code**.
3. Paste the code and confirm. Everything downloads automatically — BepInEx, Jötunn, MultiUserChest and **Project Sorter** — in exactly the right versions.
4. Select the imported profile. Done.

## Step 2 — Manual fallback (only if the code doesn't work)

1. With your profile selected, open the **Online** tab. Search and install: **Jotunn** (by ValheimModding), then **MultiUserChest** (by MSchmoecker). BepInEx installs automatically with them.
2. Get the file **ProjectSorter.dll** from Light.
3. In r2modman: **Settings** → **Locations** → **Browse profile folder**. In the Explorer window that opens, go into **BepInEx** → **plugins** and paste **ProjectSorter.dll** there.

## Step 3 — Launch and verify

1. In r2modman click **Start modded** (big button, top-left). **Always launch through this button** — starting from Steam launches without mods.
2. Load into any world. Open a chest: if you see small extra buttons (**Sorter**, **Pin**) under the chest panel, everything works.

---

## If something goes wrong

| Problem | Fix |
|---------|-----|
|---------|-----|

|                                           |                                                                                                                                   |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Server says “Incompatible version”        | You launched from Steam instead of <b>Start modded</b> — or your mods are outdated. Re-import the newest profile code from Light. |
| A dialog lists missing or mismatched mods | That dialog is intentional and names exactly what's wrong. Easiest fix: re-import the current profile code.                       |
| No extra buttons on chests                | Mods didn't load — wrong profile selected in r2modman, or you didn't launch via Start modded.                                     |
| Valheim updated and modded launch breaks  | Don't update or change mods yourself — versions must match the server exactly. Ping Light and wait for the updated code.          |
| I'm on Xbox / Game Pass                   | Not supported — mods require the Steam version.                                                                                   |
